MoneyMic

A Voice-First AI Agent for Spending Alignment

Keep your spending aligned with your intentions.
MoneyMic understands why you spend, not just where your money goes. It uses natural voice conversations to resolve missing financial context and helps users stay within the spending limits they set for themselves.

THE PROBLEM

UPI and digital payments have made spending effortless, but transaction records typically reveal the amount and recipient, not the actual purpose.

A payment of 850 to a friend could be a dinner expense, a reimbursement or a personal transfer. Conventional expense trackers cannot reliably establish this context without manual input.

People consequently struggle to keep actual spending aligned with what they intended to spend.

OUR SOLUTION

MoneyMic is a proactive spending-alignment agent, not another expense tracker.

Users establish their own financial intentions. MoneyMic processes transaction information, identifies uncertainty that could materially affect spending, and selectively asks the user for clarification through natural voice conversations.

Verified context is remembered, and spending calculations are automatically updated.

HOW IT WORKS

1. **Set an intention:** Define a category, spending limit and period.
2. **Understand transactions:** Import transaction statements and identify merchants, categories and unknown purposes.
3. **Assess materiality:** Determine whether unresolved transactions could change the user's spending assessment.
4. **Ask selectively:** Request a short voice clarification only when the missing context matters.
5. **Remember and recalculate:** Preserve verified context and update the spending trajectory using deterministic financial calculations.

ILLUSTRATIVE SCENARIO

A user sets a monthly Dining intention of 3,000.

By November 10, the expected spending is 1,000.

Blue Tokai	240
Swiggy	420
Unknown transfer to Rohan	850
Unknown transfer to Sunil	50

MoneyMic stays silent on the 50 ambiguity but asks about the 850 transfer because resolving it could change the spending assessment.

GNANI AI INTEGRATION

Gnani is central to MoneyMic's voice interaction.

Gnani Prisma v2.5 : Speech to Text(STT)
Processes actual microphone recordings and converts natural Hindi/Hinglish responses into text. This enables users to clarify transactions in the way they naturally communicate, including code-mixed speech.

The returned transcript enters MoneyMic's reasoning and context-resolution workflow. The application validates the interpretation before updating verified financial information.

Technology architecture

- **Gnani Prisma v2.5:** Voice understanding and transcription.
- **Gemini:** Context interpretation and structured information extraction.
- **MoneyMic Agent:** Selective-intervention decisions and contextual memory.
- **Financial Engine:** Deterministic spending calculations and server-side verification.

WHAT MAKES MONEYMIC DIFFERENT?

- **Decision-aware interruption:** It does not ask about every unknown transaction; it asks only when the answer could matter.
- **Voice-native Indian experience:** Users communicate naturally rather than manually categorising every payment.
- **Contextual memory:** Verified information reduces repetitive questions without assuming every future transaction has the same purpose.
- **Trust by design:** Unknown information remains unknown until sufficiently verified. Financial arithmetic remains deterministic and server-controlled.

WHO IS IT FOR?

Indian digital-payment users, particularly students and early-career professionals who make frequent digital payments and want to manage spending without maintaining manual expense logs.

PRODUCT SCOPE

The current MVP supports user-provided CSV transaction statements and actual Gnani voice transcription. It does not claim live bank connectivity or arbitrary UPI payment control.
